Patient: Beatrice Jacobs
Species/Breed: Dog / Doberman
Age/Gender: 2 Year(s) / female
Submitted Date: 06/08/2021 04:49:10 PM
Completed Date: 06/09/2021 12:25:09 PM

Case Status/Priority: Completed / Regular

Case History:

Pre-breeding Screening, hips and elbows

Case Report:

529607 KW/ml

Three digitalized radiographic images containing projections of the pelvis and elbows were submitted for evaluation. The radiographs are dated 6/4/21.

Radiographic Findings:

Both femoral heads are located in their respective acetabula with approximately 50% of the femoral heads located medial to the dorsal acetabular rims.

Both femoral heads are congruous with the acetabula with slight widening of the medial aspect of the right coxofemoral joint. No osteophyte formation is present on the femoral necks or acetabula.

Alignment of the patellae with the femurs is normal.

Muscle volume in both hind legs is within normal limits.

The anconeal process of both ulnae and proximocranial aspect of both radii are smooth with no evidence of osteophyte formation.

No sclerosis is associated with the ulnar notches.

Both medial coronoid processes are smooth in contour and a fragment associated with the medial coronoid processes is not identified.

Diagnosis: Normal pelvis and elbows.

Comments: Radiographic changes to suggest elbow or hip dysplasia are not present. Based on the OFA scheme evaluating hips, the hips would be rated as good in conformation. The clinical status of the patient will determine if further assessments pelvis and elbows radiographically would be necessary.
